

MOUNYA INAMPUDI

Dear Hiring Manager,

I'm excited to apply for the Machine Learning Engineer role at LiveView Technologies. What stood out to me is the combination of real-world security systems, edge AI, and multimodal ML, which is exactly where I've been working.

At Qualcomm, I built real-time computer vision systems for object detection and scene understanding, deployed on edge devices handling live camera and sensor data. I spent a lot of time optimizing models for latency and reliability—quantization, compression, and tuning pipelines so they actually work in production, not just in notebooks.

More recently, I've been working on LLM and multimodal systems, including RAG pipelines and agentic workflows. I've built systems that combine vision + text + structured data, with evaluation loops and monitoring to keep outputs reliable. I'm comfortable deciding when to use ML vs rules, and designing systems that balance accuracy, cost, and performance.

I enjoy working on ambiguous problems—figuring out what's worth solving, building quickly, and iterating based on real-world feedback. The chance to work on edge + cloud ML systems for security and monitoring is exactly the kind of impact I'm looking for.

Would love to contribute to the team.

Best,
Mounya Inampudi
