

MOUNYA INAMPUDI

Dear Hiring Team,

This role stood out to me because it's focused on what I care about most—building AI systems that actually get used, not just prototypes.

In my recent work, I've built and deployed LLM-powered systems end-to-end, including RAG pipelines, agentic workflows, and automation tools. For example, I developed a document intelligence system that replaced manual workflows with structured, auditable outputs, and a Bedrock-based agent pipeline that automated product data processing in production. In both cases, the real work wasn't just the model—it was designing the system so outputs were reliable, measurable, and usable by downstream teams.

I'm comfortable working in the kind of environment you describe—moving fast, shipping early, and then owning what's in production. I've built evaluation pipelines, monitoring loops, and feedback systems to track real-world performance and improve outputs over time. I also enjoy working closely with stakeholders to understand how decisions are made and where AI can actually replace or support those workflows.

What excites me about this role is the focus on operational impact and trust—building systems that people rely on in real workflows, where auditability and usability matter as much as accuracy. That's the kind of problem I want to spend my time on.

Best regards,
Mounya Inampudi
